

Supplementary Materials Description

The package contains:

- **Benchmarks** – A collection of WebAssembly benchmark programs and input data used to evaluate the performance and memory safety of the WARDuino interpreter on CHERI hardware. The set includes both standard Wasm microbenchmarks and custom test cases designed to trigger spatial memory violations.
- **WARDuino Test Video** (`WARDuino_test.mp4`) – A screen recording that demonstrates the ported WARDuino interpreter running on the Arm Morello platform. The video shows the basic functionality of the interpreter and its ability to correctly execute WebAssembly modules under CHERI hardware capability protection.
- **Partial Morello Manual Test Demonstrations**(`Morello_test.mp4`) – Additional video clips illustrating selected manual test steps performed during the evaluation. These videos visually confirm key behaviors such as capability bounds enforcement and the detection of out-of-bounds memory accesses, complementing the automated experimental results reported in the paper.

A complete automation framework that executes the full experimental evaluation without manual intervention. These scripts replicate the performance measurements and safety violation tests described in the paper, enabling reviewers to verify the results independently.

All artifacts have been anonymized and are intended for Artifact Evaluation. They require an Arm Morello hardware platform or the corresponding QEMU emulator, along with a CHERI-enabled LLVM toolchain. Detailed setup and usage instructions are provided in the repository `README.md` file included in the package.
